The driver was per-amplified cDNAs from pools of 5,000 clones made from the same filtraries. The peels consisted of the following libraries and cloneIDs: Soares NbHSF pool 1: 1,00384 310012, 727208-721845, Soares NbHSF pool 1: 1,0032-147335, 147720-148103, 148872-149255, 15002-150407, 151176-152327 Soares Nb2HF8-9W pool 1: 758280-760583, 772104-774407 Soares NbHPA pool 1: 758280-760583, 772104-77
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note="urgan: pooled: Vector: pi7i30-Fac (Pharmacia) with
a modified polylinker: Site_1: Not I; Site_2: Foo Ri:
Equal amounts of plasmid DNA from five normalized
Libraries were mixed, and ss circles were made in vitro.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /clone="IMAGE:2144771"

                                                                                                                                                                        site, Receptor framments which interact with molatonin, or specific intibodies, may be used as receptor another, in the second of the second in the respector another site. Associate may be used in the rapy of circadian rhythmedisorders such as jet-lag or day-night cycle disorders, to control involution, or in alternation of reproductive cycles in seasonally broading on minals. Antagonists may be used to control the initiation or timing of puberry in humans. The receptor gene may also be expressed in a transgrapic animal for use as a model system.
                                                                                                                                                                                                                                                                                                                                    transmembrane domain, and an NAXXY motif in transmembrane-7, rather ham NPXXY. A CYICHS motif, which is a consensus site for cytochrome-c tamily beme binding, is present in both 1b and la type temptots. The N-terminus centains 1 consensus N-dlycosylation for the N-terminus centains and new N-terminus centains
                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence represents a novel human high-affinity melatonin-lb receptor (moi.wt. 40,188), which is a membrane protein, ecupled quantum nucleotide binding proteins (G-proteins), with 7

This sequence is a new form of the melatonin receptor designated MEL-1Ab, also known as Mel 1-c(beta). The protein differs from previously known receptors by being 65 amino acids shorter and also differs throughout the sequence by 6 amino acids. The protein is envised by 2 different alleles (T79065-6) which differ in the 3 untranslated region (both sequences encode the same protein), which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       thought to affect the half-life of the mRNA. The coding sequence was isolated from cDNA derived from Xenopus skin RNA and amplified using the primers T79067-76. The nucleotide sequence encodes a 7 transmembrane receptor involved in cellular signalling. MEL-LAb has been shown to modulate intracellular cGMP, esp. inhibiting its accumulation induced by an inhibitor of phosphodiesterase, but unlike the MEL-lAa protein, it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence

V and VI may introduce kinks in the alpha-helices to form of a ligand binding pocket. Phosphorylation sites in the crading may be involved in receptor regulation. Primers from the encoding DNA may be used for isolation of sheep, mouse and human receptor sequences. Receptor fragments which interact with melatonin, or specific antibodies, may be used as receptor-agonists or receptor-antiqonists. Agonists may be used in therapy of circadian rhythm disorders such as jet-lag or day-night cycle disorders, to central evulation, or in alteration of reproductive yeles in seasonally breeding animals. Antagonists may be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    has an N-linked dlycosylation site typical for G-protein-coupled receptors, and 2 Cys residues in the 1st 2 extracellular loops may form a stabilizing disulfide bond. Pro residues in transmembrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          47,424) from Xenopus laevis. The receptor is a membrane protein, coupled to quanine nucleotide binding proteins (G-proteins), and has 7 hydrophobic putative transmembrane domains. The N-terminus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence represents a high-affinity melatonin receptor (mol.wt 47,424) from Xenopus laevis. The receptor is a membrane protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA encoding high affinity melatoric receptor one coused to identify receptor agenists or antagonists e.g. for regulating circadian thythmoliantees or reproductive cycles
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               W09535320-A1

The protein differs from previously known receptors by being 65 amino acids shorter and also having 2 different c-terminal amino acids. The protein is encoded by 2 different allels (174363.4) which differ in the 3 encoded by 2 different allels (174363.4) which differ in the 3 encoded by 2 different allels (174363.4) which differ in the 3 encoded region (both sequences encode the same protein), which is thought to affect the half-life of the mRNA. The coding sequence was isolated from CDNA derived from Xenopus skin RNA and amplified using the primers T79067-76. The nucleotide sequence encodes a 7 transmembrane receptor involved in cellular signalling. MEL-1Aa has been shown to inhibit adenylyl cyclase, but both proteins can modulate intracellular composers allegations of the proteins can modulate intracellular shoes been shown to be the sequence when the sequence were different allegations of the sequence when the sequence were different allegations of the sequence were different and the sequence were different a

melatonin receptor-agonist; melatonin receptor-antagonist;
circadian rhythm disorder; jet-lag; day-night cycle disorder;
ovulation; reproductive cycle; animal breeding; pubcrty;
transgenic animal; drug screening.
                                   DNA encoding high affinity melatonin receptor one - used to identify receptor agonists or antagonists e.g. for regulating circadian

A partial sequence is given in PH8411. The N-terminus contains 2 consensus N-glycosylation sites, compared to 1 site in the Xenopus receptor (R88409), and the compared to 1 site in the Xenopus receptor (R88409), and the compared to 1 site in the Xenopus receptor (R88409), and the compared to 1 site in the Xenopus receptor (R88409), and the compared to 1 site in the Xenopus receptor antibodies, may be used as receptor approximates of receptor antibodies, may be used for the trappy of circadiat, rhythm disorders such as jet-lay or day-night cycle disorders, to control ovulation, or in alteration of reproductive cycles in seasonally breeding animals. Animacounts of humans. The receptor gene may also be expressed in a transgenic control of the initiation of puberty in the receptor gene may also be expressed in a transgenic control control control cycles in a model system to screen agenists and antagenists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The melationin receptor antagonist can be used as an event for preventing of treating melancholla, neurosis, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        encoding this sequence is used in an expression vector designated pAKKO-hMeIR7. The expression vector is used to produce the chinese hamster overly (CHO) reals of the invention. The CHO cells express the human melatonic receptor protein, and can be used to identify compounds (such as agonists and antagonists) having affinity to the receptor. The CHO cells can also be used to produce the receptor. The melatonic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               melatonin receptor protein, which comprises an animal cell containing an expression plasmid for the gene encoding a human melatonin receptor protein. The cells are useful for screening for human melatonin receptor proteins and its agonist or autabouist e.g. bormones and synthetic compounds, by measuring changes in metabolic activity. The recombinant human melatonin receptor protein is useful as it has the same activity as natural human melatonin receptor protein. The new screening method is better than prior art radioimmunoassay techniques at quantitatively determining melatonin, which uses antibodies produced by linking
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New melatonin-receptor expression cells - useful for screening for human melatonin receptor proteins and agonists and antagonists % \left( 1\right) =\left\{ 1\right\}

Receptor fragments which interact with melatonin, or specific artikelies may be used in therapy of or receptor-antagonists. Agentists may be used in therapy of circalian thythm discretes such as jet lag or day-night cycle disorders, to control evulation, or in alteration of improductive control the initiation or timing of puberty in humans. The receptor gene may also be expressed in a transpenic animal for use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ENA encoding high affinity melatonin to eptor one cosed to identify receptor agenists or antagonists e.g. for regulating circadian thythm disorders or reproductive cycles

                                    The sequence represents a sheep high-affinity melatonin-la receptor, which is a membrane protein, coupled to quantine nucleotide binding proteins (6-proteins), with 7 hydrophobic putative transmembrane domains. Receptor fragments which interact with melatonin, or specific antihodies, may be used as receptor-agonists or receptor-antagonists. Agonists may be used in
     receptor-agonists or receptor-antagonists. Agonists may be used therapy of circadian rhythm disorders such as jet-lag or day-nigh cycle disorders, to control ovulation, or in alteration of reproductive cycles in seasonally breeding animals. Antagonists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Modified-site

                                                                                                                                                                                                                                                                                                                                                  eyone disorders, to control ovulation, or in alteration of reproductive cycles in seasonally breeding animals. Antagonists may be used to control the initiation or timing of puberty in humans. The receptor gene may also be expressed in a transpenic unimal for use as a model system to screen agonists and antagonists.
                                                                                                                                                                                                                                                                                                                                                                                                            sequence is liven in P88412. Receptor fragments which interact with melatoria, or specific antibodies, may be used as receptor-parameters or receptor-antiagonists. Agonists may be used in therapy of circadian rhythm disorders such as jet-lag or day-night cycle disorders, to control cycle, or in alteration of reproductive cycles in sassurally breeding animals.
